

MHI • Next-Day Stats After Big Up/Down Days

For Gary Leung. Universe = Day Summary filled days n=186 (2025-11-27 → 2026-09-01), consecutive pairs=185. Primary measure = **body = close – AO** (AO = 09:15 open, MAD=0 vs 1-min). Also close-to-close tables. Flat = |body|<20. Font: embedded Noto Sans TC. Observation note — not a live system.

Headline (honest): After prior body UP ≥200 (n=27): next body mean=-72.2, med=-74.0, % next down=63% (baseline %dn=54%). % next body ≤-200 = 30% — soft lean, not equal-size mirror. At UP ≥300 n=9 only — small sample. Joint “up 300 then next down 300” = 3/9 (33% of those ups; 1.6% of all pairs). Use as soft short-leaning conditional bias at Upper wall / ORH — **location first**. Not a short-the-open system.

Caveats: (1) Sample is one MHI stretch (~9 months); regimes change. (2) n shrinks fast above 250–300 — percentages are noisy. (3) Soft lean ≠ edge you can harvest at the open without location/absorption. (4) Half-days and missing 1-min days affect AM/PM split (AM body uses lunch close from 1-min when present). (5) No costs, no slippage, no selection on intraday path — body is end-of-day. (6) Correlation across thresholds (nested sets) — do not stack “significance” .

1. Universe & unconditional baseline

Item	Value
Filled days	186
Date range	2025-11-27 → 2026-09-01
Consecutive pairs (prior→next)	185
Day range mean / med	374.9 / 349.0
Body (C-AO) mean / med / p10 / p90	-23.7 / -35.5 / -341.5 / 236.5
Body mean / med	182.3 / 144.5

open-to-close ≡ body (close – AO); AO verified = 09:15 open. Close-to-close = today close – prior close (first day has no ctc).

Baseline next-day body (every pair)

Prior	n	mean	med	p10	p90	%up/dn/flat	%≤- / %≥+100	%≤- / %≥+150	%≤- / %≥+200	%≤- / %≥+250	%≤- / %≥+300	next rng / %≥300
Unconditional next	185	-24.3	-36.0	-341.8	238.2	39/54/7	35/30	27/21	19/15	17/10	14/5	375.3 / 67%

Hit columns for baseline show % next body ≤-T / % ≥+T. Use this row to judge whether conditionals actually lean.

2. After prior |body| thresholds (primary)

After prior UP: hit columns = % next body ≤-T. After prior DOWN: hit columns = % next body ≥ +T.

Prior	n	mean	med	p10	p90	%up/dn/flat	% hit100	% hit150	% hit200	% hit250	% hit300	next rng / %≥300
UP ≥150	39	-31.7	-49.0	-354.4	285.8	41/56/3	41%	36%	23%	21%	21%	386.1 / 67%
DOWN ≤-150	49	-18.8	-2.0	-404.2	254.2	45/47/8	35%	27%	18%	12%	6%	401.0 / 80%
UP ≥200	27	-72.2	-74.0	-360.8	195.2	33/63/4	48%	44%	30%	26%	26%	387.4 / 70%
DOWN ≤-200	36	-47.9	-26.5	-428.5	236.5	42/50/8	33%	25%	17%	11%	6%	402.3 / 75%
UP ≥250	18	-73.7	-94.5	-383.0	298.1	33/61/6	50%	44%	33%	33%	33%	440.8 / 89%
DOWN ≤-250	32	-39.0	-26.5	-422.4	247.3	41/50/9	31%	25%	16%	12%	6%	398.8 / 75%
UP ≥300	9	-23.6	-72.0	-391.4	440.2	33/67/0	44%	44%	33%	33%	33%	441.8 / 78%
DOWN ≤-300	26	-60.7	-47.0	-428.5	260.5	35/54/12	27%	19%	15%	15%	8%	404.3 / 69%
UP ≥350	8	23.1	-60.5	-327.0	449.3	38/62/0	38%	38%	25%	25%	25%	440.4 / 75%
DOWN ≤-350	17	-20.6	-45.0	-327.0	320.8	35/53/12	35%	24%	18%	18%	12%	393.4 / 65%

3. After prior |close-to-close| thresholds

Same layout; prior move = close–close. Nested with body but not identical (gap / prior close vs AO).

Prior	n	mean	med	p10	p90	%up/dn/flat	% hit100	% hit150	% hit200	% hit250	% hit300	next rng / %≥300
UP ctc ≥150	56	-37.2	-56.0	-385.0	248.5	36/61/4	39%	34%	23%	20%	20%	389.7 / 70%
DOWN ctc ≤-150	62	-13.9	-5.0	-342.7	243.3	44/47/10	32%	24%	15%	10%	3%	381.2 / 69%
UP ctc ≥200	48	-33.2	-56.0	-383.0	292.5	33/62/4	40%	35%	23%	19%	19%	387.7 / 69%
DOWN ctc ≤-200	56	-24.3	-15.0	-350.0	247.5	43/50/7	32%	23%	12%	11%	4%	391.3 / 71%
UP ctc ≥250	36	-50.1	-71.5	-390.5	306.0	31/69/0	44%	42%	25%	19%	19%	393.8 / 67%
DOWN ctc ≤-250	42	-22.5	-24.5	-394.8	249.5	40/50/10	33%	24%	14%	12%	5%	396.8 / 71%
UP ctc ≥300	28	-55.0	-67.5	-392.1	259.6	29/71/0	39%	39%	21%	18%	18%	385.0 / 68%
DOWN ctc ≤-300	37	-39.5	-41.0	-373.8	247.0	38/51/11	32%	22%	14%	11%	3%	388.2 / 68%
UP ctc ≥350	21	-66.9	-71.0	-348.0	190.0	19/81/0	38%	38%	19%	14%	14%	363.8 / 67%
DOWN ctc ≤-350	22	-27.5	-5.0	-422.4	268.9	41/45/14	36%	27%	18%	18%	5%	414.6 / 77%

4. Prior range ≥ thr + close location (terciles)

Top tercile = close in upper third of prior day range (bullish close location). Bottom = lower third. After a wide day that closed strong: is next body soft-down? Symmetric for weak closes.

Prior	n	mean	med	p10	p90	%up/dn/flat	% hit100	% hit150	% hit200	% hit250	% hit300	next rng / %≥300
r≥250 top tercile	48	-29.2	-43.5	-357.6	233.1	40/56/4	40%	35%	23%	19%	19%	374.7 / 62%
r≥250 bot tercile	59	17.6	5.0	-340.6	273.0	49/39/12	37%	29%	20%	14%	7%	396.7 / 76%
r≥300 top tercile	41	-36.8	-72.0	-380.0	245.0	39/56/5	46%	41%	27%	22%	22%	393.1 / 71%
r≥300 bot tercile	48	-11.5	-2.0	-359.8	274.0	44/44/12	33%	27%	21%	15%	6%	401.1 / 75%
r≥350 top tercile	32	-35.3	-60.5	-389.0	270.2	41/56/3	47%	41%	31%	28%	28%	417.7 / 81%
r≥350 bot tercile	37	-22.4	-2.0	-409.4	258.4	43/43/14	30%	24%	19%	14%	8%	410.6 / 76%

5. Range day vs trend day prior

Range-day prior: close in middle 20–80% of that day’ s range. Trend-day: close in outer 20% (near high or low).

Prior	n	mean	med	p10	p90	%up/dn/flat	%≤- / %≥+100	%≤- / %≥+150	%≤- / %≥+200	%≤- / %≥+250	%≤- / %≥+300	next rng / %≥300
After range-day (n prior=108)	108	2.1	-24.5	-289.0	270.9	43/53/5	31/33	23/24	16/17	14/12	9/6	383.6 / 70%
After trend-day (n prior=77)	77	-61.4	-49.0	-390.4	206.2	35/55/10	40/25	32/17	25/12	22/6	21/4	363.6 / 62%

Brief: compare means/medians and %up/dn to baseline. Trend-day priors are the ones that “finished at an extreme” ; range-days finished mid — next-day lean is usually milder than big-body filters.

6. After prior up ≥200: next AM body vs PM body

AM body = (last 1-min close ≤12:00) – AO. PM body = day close – lunch close. Requires 1-min overlap (182 days; half-days may omit PM).

Prior	n	mean	med	p10	p90	%up/dn/ flat	%≤- / %≥+100	%≤- / %≥+150	%≤- / %≥+200	%≤- / %≥+250	%≤- / %≥+300	next rng / %≥300
Next AM body (n=27)	27	-72.8	-89.0	-313.8	165.4	30/67/4	44/19	37/11	26/7	15/7	11/4	— / —%
Next PM body (n=26)	26	-0.3	-5.5	-109.0	129.5	35/46/19	15/19	4/8	4/4	4/0	0/0	— / —%

If AM already carries most of the mean lean, the soft bias is front-loaded; if PM carries it, do not front-run the open. Read the numbers — do not invent.

7. Monthly stability (|prior body| ≥200)

Small n (<8) labelled. Do not over-read a single month.

Month	Prior side	n	next mean	next med	% next dn	% next up	Note
2025-12	up	4	-116.0	-131.0	75%	25%	SMALL n
2025-12	dn	5	29.4	100.0	20%	80%	SMALL n
2026-01	up	4	-53.5	-168.0	75%	25%	SMALL n
2026-01	dn	2	-192.5	-192.5	50%	50%	SMALL n
2026-02	up	4	-229.2	-338.0	75%	25%	SMALL n
2026-02	dn	6	51.5	92.5	33%	50%	SMALL n
2026-03	up	4	150.8	150.0	25%	75%	SMALL n
2026-03	dn	7	-55.3	88.0	43%	57%	SMALL n
2026-04	up	2	-77.5	-77.5	100%	0%	SMALL n
2026-04	dn	2	181.5	181.5	0%	100%	SMALL n
2026-05	up	1	84.0	84.0	0%	100%	SMALL n
2026-05	dn	5	-184.2	-45.0	60%	0%	SMALL n
2026-06	up	2	-273.0	-273.0	100%	0%	SMALL n
2026-06	dn	6	-193.2	-173.5	100%	0%	SMALL n
2026-07	up	5	11.4	-20.0	40%	40%	SMALL n
2026-07	dn	1	492.0	492.0	0%	100%	SMALL n
2026-08	up	1	-397.0	-397.0	100%	0%	SMALL n
2026-08	dn	2	-91.0	-91.0	100%	0%	SMALL n

8. Confusion / joint probability

“Up T then next down T” = prior body ≥+T and next body ≤-T. Conditional % is of prior-up days; joint % is of all consecutive pairs.

T	# prior up	# prior dn	up→dn (cond%)	dn→up (cond%)	up→up	dn→dn	joint P(up→dn)
200	27	36	8 (30%)	6 (17%)	3	10	4.3%
250	18	32	6 (33%)	4 (12%)	2	6	3.2%
300	9	26	3 (33%)	2 (8%)	2	5	1.6%

9. Interpretation & playbook tie-in

- **Soft lean after big up days exists:** after prior body ≥+200 (n=27), next body mean -72 / med -74 vs unconditional -24 / -36; % next down 63% vs baseline 54%; % next ≤-200 = 30% vs baseline 19%. Real lean, but **not an equal-size mirror** — only ~1/3 of +300 days are followed by a full -300 (3/9).
- **Asymmetry:** after prior body ≤-200 (n=36), next mean is still negative (-48) — big down days do not print a clean bounce. Do not force symmetry.
- **Front-loaded:** after +200, next AM body mean -73 / med -89 while PM body ≈0. Soft bias is mostly morning; do not invent a PM fade from these numbers.
- **n is small at 300+** (n=9 up-side) — treat those rows as sketches. Monthly buckets are almost all SMALL n.
- **Use as soft short-leaning conditional bias** when price is already at Upper wall / ORH and location/absorption agree — location first. Wide prior day + top-tercile close (r≥300 top, n=41) also softens next (med -72) but still not a system.
- **Not a short-the-open system.** No automatic fade of AO after a +200/+300 day.
- **Playbook:** big prior up raises mean-reversion pressure; entries still wait for failed break / absorption at the wall — same discipline as morning plan / SR / emotion notes.

Quick reference (body = C-AO)

Filter	n	next mean	next med	% next dn	% next ≤-200
Baseline	185	-24.3	-36.0	54%	19%
Prior UP ≥200	27	-72.2	-74.0	63%	30%
Prior UP ≥300	9	-23.6	-72.0	67%	33%

Prior DOWN ≤ -200	36	-47.9	-26.5	50%	— (bounce % $\geq +200$ = 17%)
Prior $r \geq 300$ + top tercile	41	-36.8	-72.0	56%	27%
